

SECTION 11

11.02 NONPOTABLE WATER SYSTEM DESCRIPTION:

The nonpotable water system is composed of the conduits, transmission mains, distribution mains and service lines, up to and including the meter or stop and waste valve, used in the conveyance of nonpotable water from off-site facilities to on-site facilities. At full implementation, it is anticipated that the system will consist of nonpotable water treatment facilities, storage facilities, nonpotable_pumping stations, well water pumping stations, supplemental chlorine addition stations and the distribution system. The nonpotable water carried in the nonpotable water distribution system may be untreated river water, well water or water treated to nonpotable standards.
